Attivo Networks Integration with Microsoft Azure Security Center for IoT

Attivo Networks ThreatDefend® solution works by creating a fabric of deceptive assets that proactively deceive and redirect attackers into revealing their presence. When attackers target IoT edge devices, attempt to conduct reconnaissance or move laterally, they will discover assets that appear identical to production systems. Any active observation will cause the attack to be redirected into the deception environment. The joint solution then raises an engagement-based alert that automatically notifies the Azure Security Center for IoT.

CUSTOMER BENEFITS

• Designed to seamlessly deploy Azure IoT modules as decoys for early and accurate threat detection.
• Security teams can deploy Attivo ThreatDirect® forwarders in remote IoT Edge devices from the Azure IoT Hub console and project, at scale, deception across the enterprise cloud, IoT, industrial, and medical networks to protect their entire infrastructure.
• Gathers forensics and company-specific intelligence on the attack to understand attacker methods, intent, and for strengthening security defenses.
